

At SignComp, we have bespoke tools to assist you during the installation of our Flex Face Systems. The tool is designed to save you time and energy, all whilst preserving the longevity of the clips themselves.

The initial stage of installing the clips is simply done with your hands. Once all your clips are in and you are happy with the positioning of your print, you can start to use our Tools. By engaging the locator within the lip of our extrusions, you 'rock' the tool from side to side to push the clips further into the frame enabling the installer to create the optimum tension.

We have several official Tension Tools within our portfolio:

Our 5135 is designed for our Econoflex and Retro Frames.

The 5137 is used with our Non-Illuminated and Front Loader Frames.

Our 5138 is specially designed for our Non-Illuminated where there is limited access around the frame.
